their ſituation, eſpecially the penguin, who certainly cannot fly at all.

It remains now to conſider, what becomes of theſe birds, during their abſence from the ſight of the inhabitants of thoſe iſlands: There muſt be ſome providential means to preſerve them unſeen, in that part of the world where they only appear in the ſummer months; for, in the ſpring, they are ſaid to appear all at once in as great numbers, as if they never had been abſent. I think the moſt rational conjecture, for the manner of hiding themſelves, and being preſerved during the long and cold winters of theſe climates, is, that there are ſub-marine caverns in the rocky ſhores of thoſe iſlands, the mouths of which caverns, though under water, may lead to hollows, ſo riſing within-ſide, as to afford a convenient dry harbour, fit to preſerve theſe birds in a kind of torpid ſtate during the winter. The ſea lying before the mouths of ſuch caverns, and they having a vaſt depth of mountain over them, their inward capacity muſt be defended from any rigid cold, which may be a means to preſerve theſe fowls; and late in the ſpring, about May, the outward warmth of the air, and the returning ſtrong ſun beams on the water, near the mouth of the cavern, may, by a ſmall degree of heat and light, re-animate, as it were, theſe animals, and bring them from their ſtate of forgetfulneſs, by degrees, to the uſe of life and motion, till at laſt they are emboldened to launch forth for another ſummer, ſeek their prey in the ocean, and propagate their ſpecies on the neighbouring rocks.
